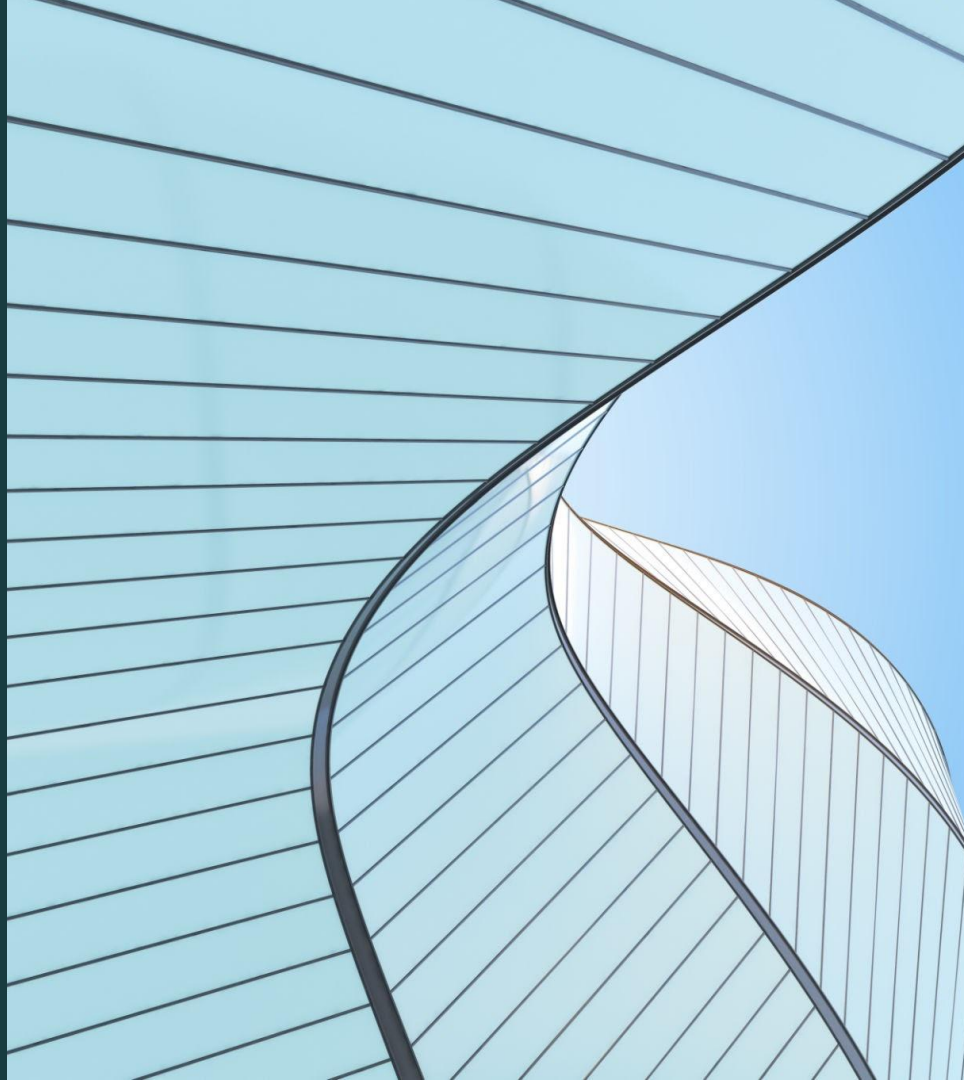
Group 20 Final Project Presentation

Group Members: Aneesh Sreekanth, Haifan Zhao, Mark Sui, Nathan Chao, Zixuan Chen



<u>Goal:</u>
Analyze whether graduates who move to high-cost states experience real income gains or whether higher nominal wages are offset by higher living expenses

Outline

I. Datasets Used

II. Data Analysis/Research

III. Interesting Questions

IV. Conclusion

Datasets Used

Adult Census Income - Survey used to track individual age, education, occupation, hours worked, income amount, and more.

US Cost of Living (Kaggle) - County-level cost of living broken down into housing, food, transportation, healthcare, childcare, and taxes.

US jobs on Monster.com (Kaggle) - Data scraped from Monster.com regarding job titles, location, salary, and sector (i.e. private/public).

Public Use Microdata Sample (PUMS) - This is the American Community Survey Public Use Microdata, which holds information such as income, state, education, occupation, and migration status.

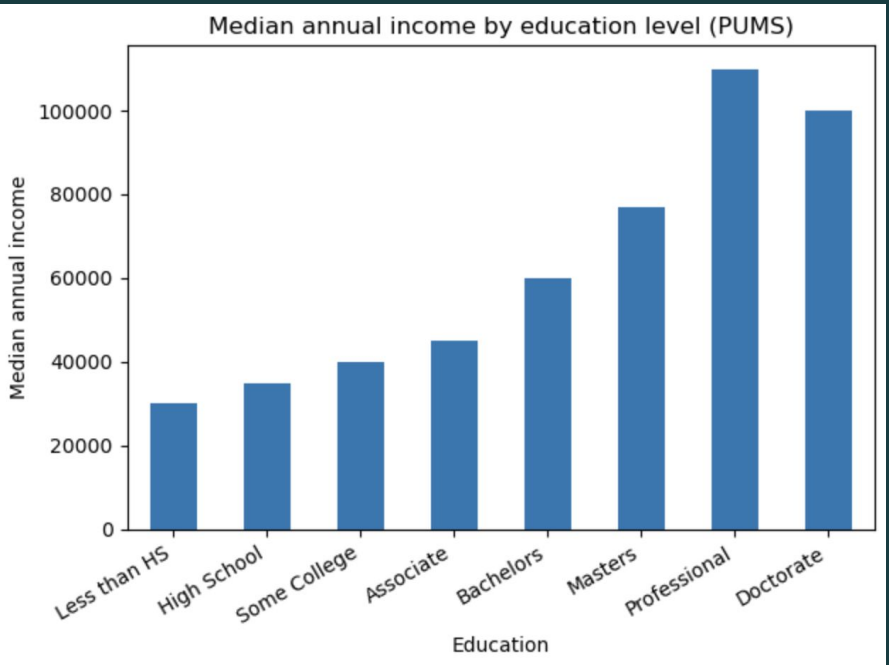
IRS SOI Migration Data - State-to-state migration flows for tax year 2021→2022, used to quantify which states people are actually moving to and from, and at what income levels.

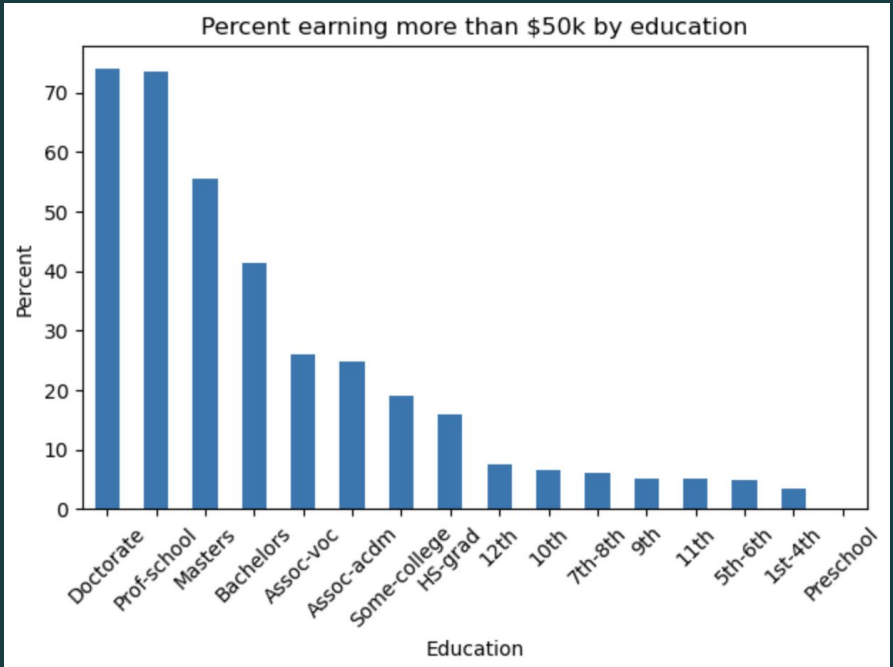
BLS Wage Files - State-to-state migration flows for tax year 2021→2022, used to quantify which states people are actually moving to and from, and at what income levels.

- wm_data_1_AllData.csv:
  - Contains the actual wage amounts for occupations
- wm_area.csv
  - Used to get state/metro info for each wage record
- wm_occupation.csv
  - Connect series ID to occupation
- wm_subcell.csv
  - Used to filter down to summary-level records only, to avoid double-counting breakdowns like union vs non-union workers

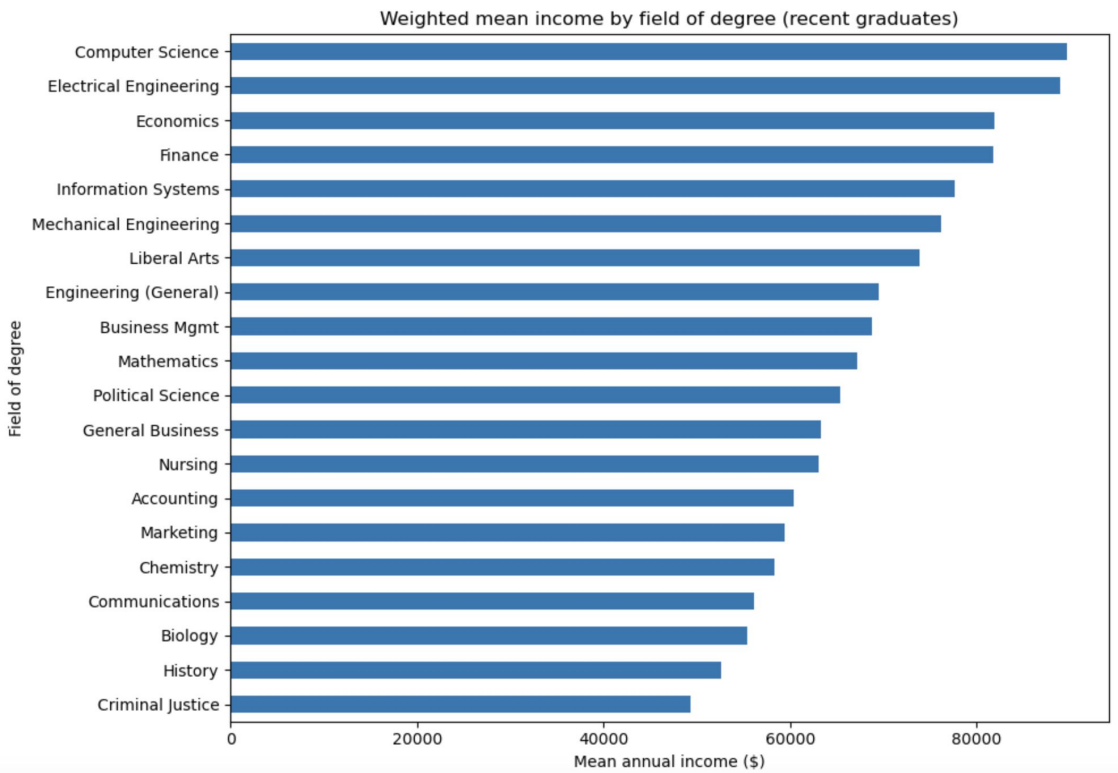
Education and Income

- Common assumption: the higher the education level, the greater the financial return
- The Adult Census confirms this, using its >$50k threshold, those with Doctorates or Professional degrees (e.g. Medicine, Law, Dentistry) show the widest earning margins
- The PUMS dataset reinforces this hypothesis by supplementing real dollar amounts rather than just a threshold
  - Even with exact salaries, we still see a slight edge towards Professional degrees in raw income power





- Common assumption: certain fields yield a higher financial return after graduation
- PUMS data confirms this using weighted mean income for recent graduates
- Computer Science and Electrical Engineering lead at roughly $90k, nearly double Criminal Justice at $49k
- Economics and Finance closely follow at $82k, outranking most engineering disciplines
- Key takeaway: field of study can matter just as much as degree level

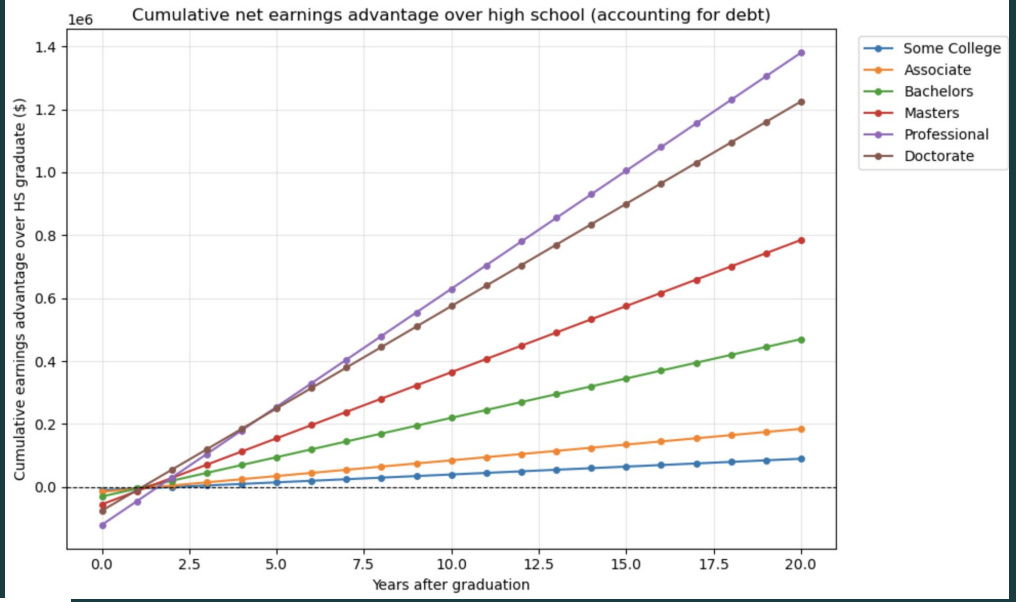


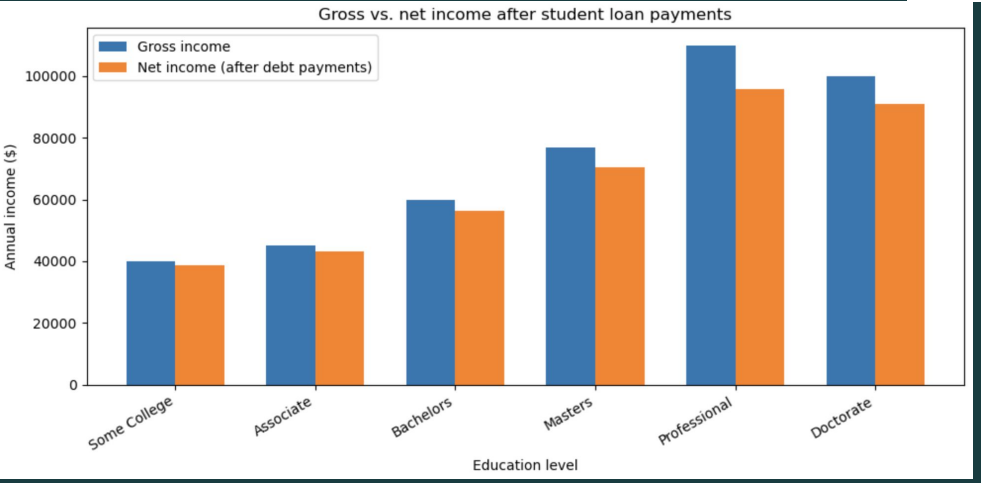
What you Study Matters

Does the Debt Pay Off?

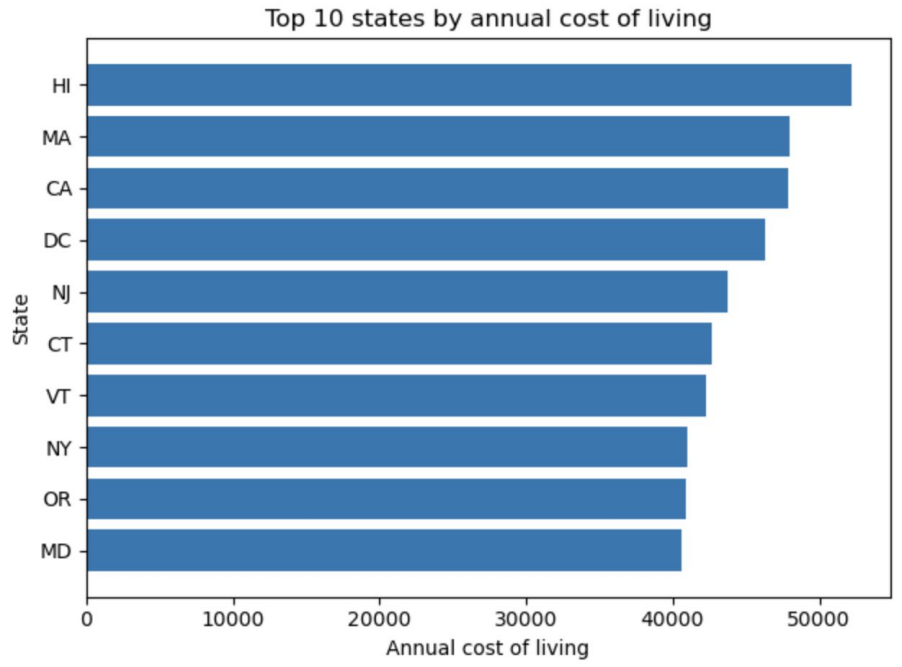
Many students also end degree study with Student Debt:

- We compared the gross income to net income at certain degree levels
- Notice that more education results in a great difference in gross income vs net income

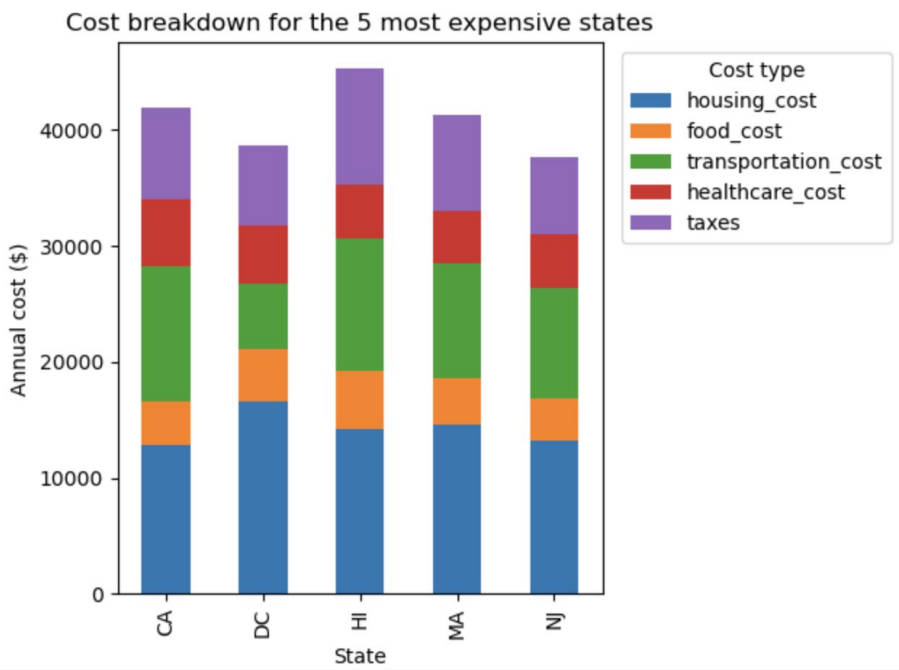




- All degree levels break even within 3-5 years, validating the upfront cost of higher education
- After 20 years, Professional degrees lead at ~$1.4M cumulative advantage over a high school graduate



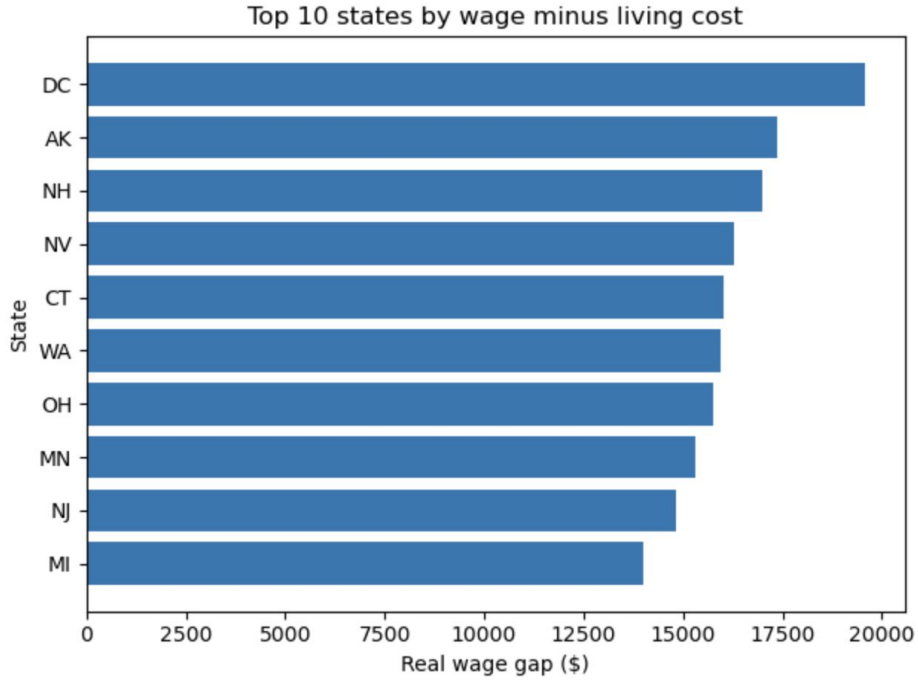
- Cost of living varies significantly by state and directly affects real purchasing power
- The three most expensive states are Hawaii, Massachusetts, and California
- Housing and transportation are the largest cost drivers, with taxes as a significant secondary factor

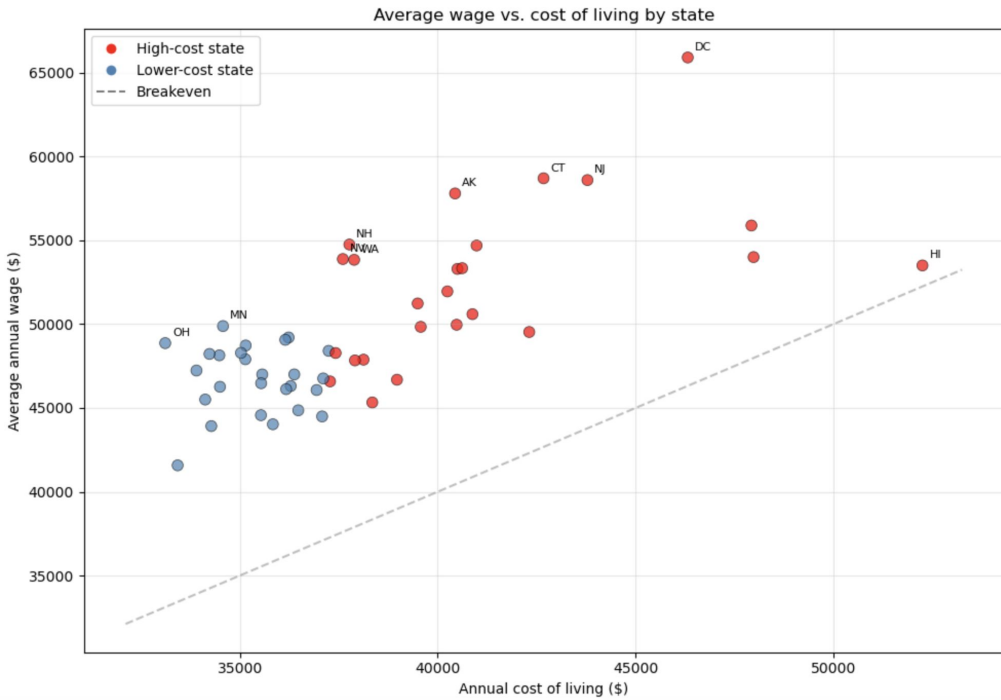


The Cost of Living Problem

Real Wage Gap

DC leads the real wage gap at nearly $20k, ahead of AK and NH, none traditionally known as the highest paying states

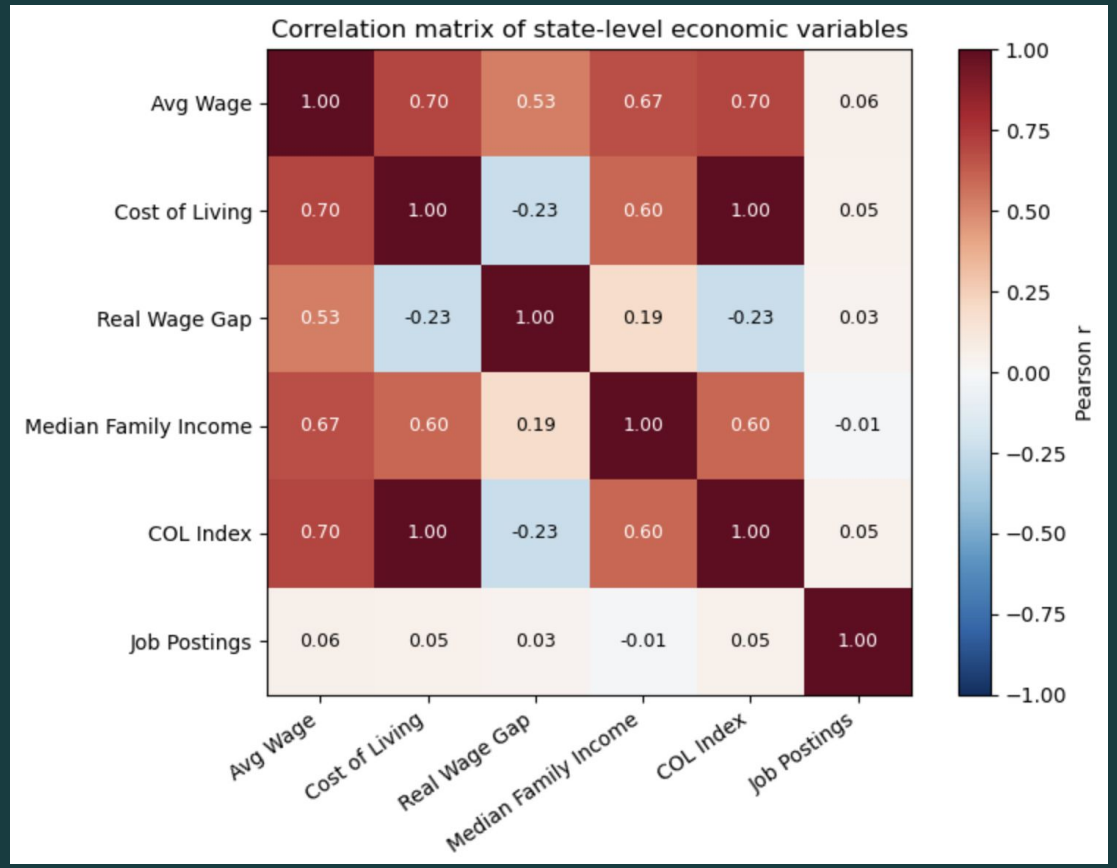




- Every state sits above the breakeven line, but high-cost states like Hawaii barely making it over
- Lower-cost states consistently show a larger gap from the breakeven line than expensive coastal states
- Key takeaway: Moving to bigger market states does not guarantee the best financial outcome

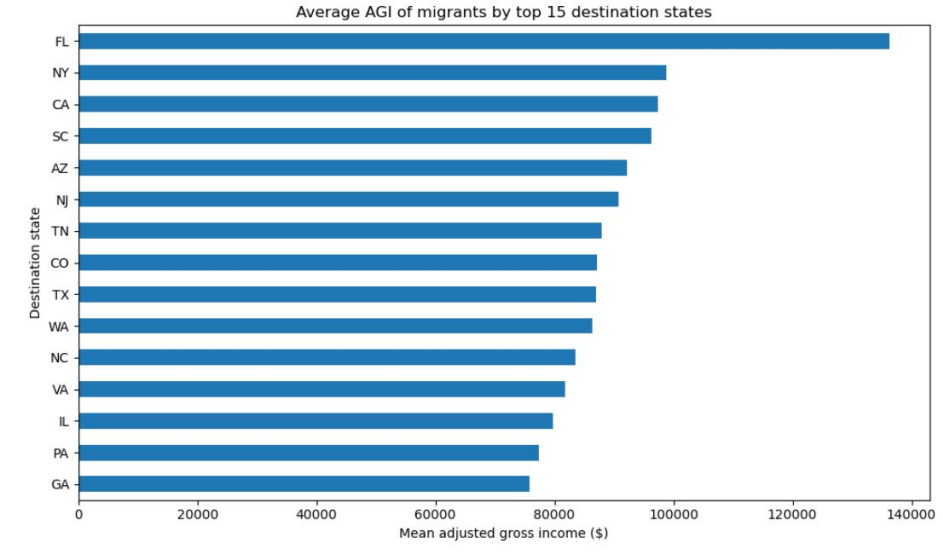
Putting it Together

- Avg Wage and Cost of Living are strongly correlated at r = 0.70, states that pay more also cost more
- Real Wage Gap vs Cost of Living shows r = −0.23, higher cost states actually tend to have a smaller real wage gap
- Job Postings show near zero correlation with all other variables, meaning volume of opportunities has no relationship to actual wages or cost of living
- Key takeaway: high wages and high cost of living cancel each other out, reinforcing the real wage gap as the most meaningful metric

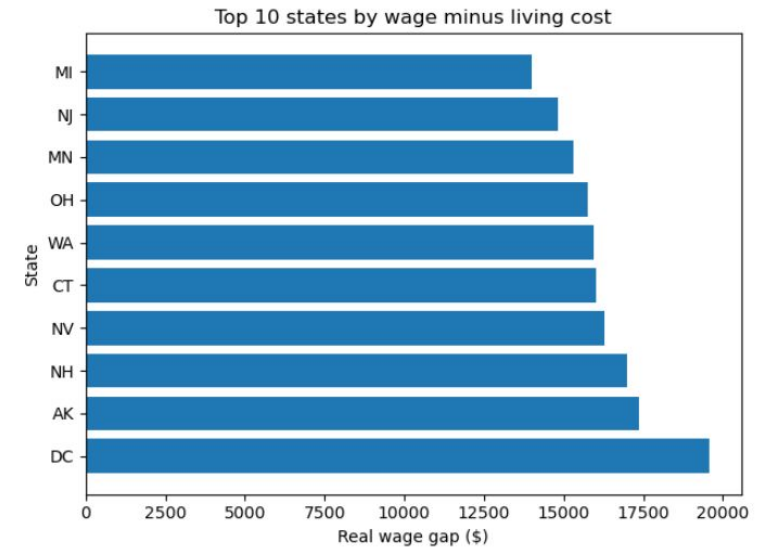


Based on wages, what are the top 3 states to move to?

Based on wages, what are the top 3 states to move to?



Nominal Income (The Illusion)



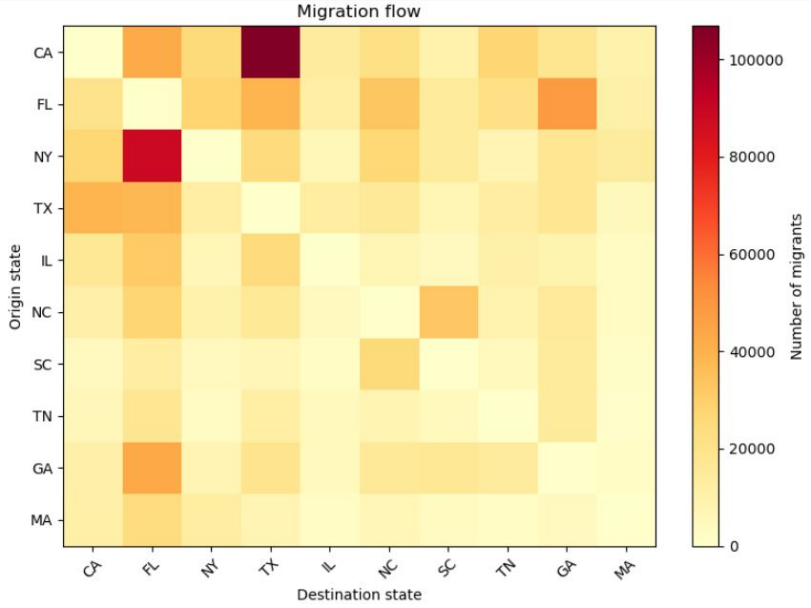
Real Purchasing Power (The Reality)

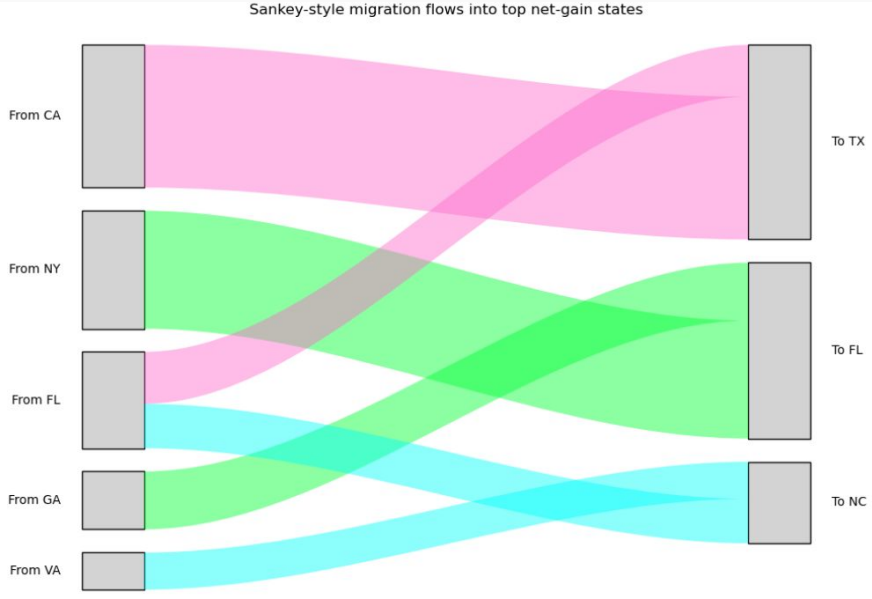
- **The "Paper Wealth" Paradox:** High Adjusted Growth Income (AGI) is maybe driven by elite industry clusters (Tech/Finance) or skewed by high-net-worth residents and no state income tax.

- **Analysis:** Gross income (AGI) measures wealth accumulation at the top, but the Real Wage Gap measures the survivability and savings potential for the average professional.

Where are people typically migrating to?

Where are people typically migrating to?





- **The "Sun Belt" Trend:** There is a massive shift from the Northeast and West Coast toward the Sun Belt (FL, TX, AZ), driven by lower taxes and more affordable housing.

- **Targeted Corridors:** Our Sankey diagram reveals specific "migration corridors," such as NY→FL and CA→TX.

- **Economic Rationality:** People aren't just moving randomly; they are following the Real Wage Gap. Even if nominal salaries are lower in TX than CA, the increase in disposable income makes the move financially rational for debt-heavy graduates.

Does level of education and age affect income?

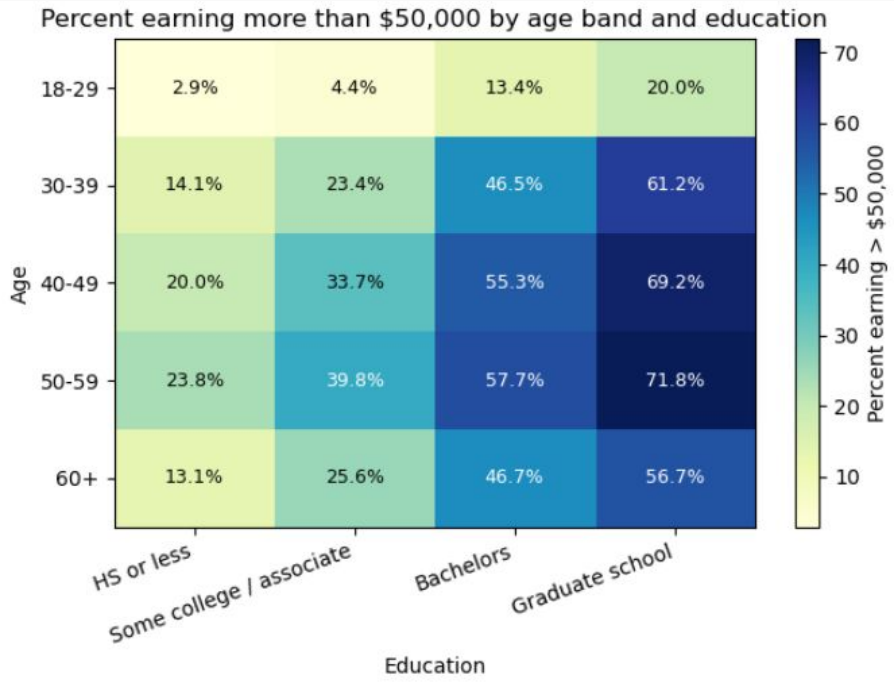
Does level of education and age affect income?

- **The "Graduate Premium":** The "Graduate school" category (combining Masters, Professional, and Doctorate) shows the highest probability of earning > $50k, exceeding 50% during peak career years.

- **Growth Potential:** While all groups see gains with age, the Bachelors and Graduate groups experience the most aggressive growth between ages 30 and 49.

- **Stagnation Risk:** Individuals in the "HS or less" category face a significant income ceiling, with fewer than 1 in 4 reaching the 50k threshold regardless of experience.

- **Strategic Takeaway:** The data justifies the initial debt of a Graduate degree as it secures a high-income trajectory that persists into later career stages.



Goal:

Analyze whether graduates who move to high-cost states experience real income gains or whether higher nominal wages are offset by higher living expenses

The Verdict: Higher nominal wages are often **NOT** enough to offset living expenses in many "Tier 1" states

Key Evidence:

- **High Correlation (r ≈ 0.88):** Wages and Cost of Living are tightly coupled. You aren't just getting paid more; you are being compensated for the "cost of existence"
- **The "Efficiency" Leaders:** DC, AK, and NH are the rare exceptions where the wage growth significantly outpaces the cost curve
- **The "High-Cost Trap":** In states like California and Hawaii, graduates experience a Real Income Loss compared to lower-cost, high-gap states
- **Migration Insight:** Our data shows that while people move toward "opportunity," many are essentially "running on a treadmill"—earning more but saving less

Final Recommendation: Graduates should prioritize "Real Wage Gap" over "Nominal Salary" when evaluating job offers to maximize long-term wealth

Thank you!
